

after a timeout. You can configure the timeout by using the `session_timeout` attribute with the `ceph fs set` command. The default value is 60 seconds.

The `session_autoclose` attribute controls eviction. If a client fails to communicate with the MDS for more than the default 300 seconds, then the MDS evicts it.

Ceph temporarily bans evicted clients so that they cannot reconnect. If this ban occurs, you must reboot the client system or unmount and remount the file system to reconnect.
